

PROJECT REQUIREMENTS DOC

Target Users.

Buzzmap's target users are consumers of all ages who want conveniences when they shop. So customers who like having a wide array of choice and pick goods and services based on client reviews and price. It is a market place for people who want to have a look around to see what's available before making their decision. Buzzmap is a market place for people who want to trust the business before making a purchase. It is for people who want to try new things and experiences but don't know where to start. It could be trying a new restaurant or hiking mt longonot, visiting a new doctor or a new lawyer, it could be a new masseuse or a new spa you want to try; at buzzmap we allow people to step into new experiences with boldness. Our target users are women and men aged 16-45. These are retail shoppers, who are buying everything from jewelry to home appliances to work tools. These are people looking to look around at the market before making their decision.

Features

1. The POV (Point of View) Feature

This is the heart of the platform's trust infrastructure. Instead of static, easily faked text reviews, users share authentic, real-time clips of their daily experiences with a business. It transforms social scrolling into a discovery engine where the review is a lived moment, effectively killing the fake store problem. From the pov you can find the location of the business and other reviews.

2. Product shelf

This is the dedicated digital storefront for buzzmap. Where smes list their inventory for sale. It is the Add to Cart layer where users go after seeing a product featured in a friend's POV experience. Unlike a standard marketplace page, the shelf displays goods alongside real-time community feedback, ensuring the item isn't a fake before the user buys. It provides a standardized, professional display for SMEs that allows a business in Nairobi to showcase its full catalog to a customer in Cape Town or Kampala with zero friction.

3. Cross-Border Accessibility

The platform is built to break geographical silos. It includes the logistics and discovery framework needed for a merchant in Nairobi to reliably reach and sell to customers in Kampala or Mombasa or Moyale solving the fragmentation issue.

4. Messaging

A dedicated messaging service between customers sharing experiences with friends, as well as communications between the business and its clients and reviewers.

They should be able to create community groups as people with a shared experience.

If not possible ...link to whats app. So when a person adds to cart and they hit checkout, they will be redirected to the business whatsapp page and they can communicate directly with the seller.

5. Create and Post feature

This will allow businesses to post content about the product and services they offer. It will also allow individual customers to post their experiences, ie; text, pictures and videos

6. Recommendation feature

Where once a customer is posting their POV they are asked whether to recommend the business to others, a small yes or no gesture will allow us to collect data on the level of experience. This paired with a star metric will allow the system to better understand customer preferences and to showcase the market truthfully, so the best get rewarded with more exposure to more customers and the rest can improve their business.

Here the business can pay for these recommendations to be advertisements on the platform. Similar to how instagram has sponsored ads. So the yes recommendations will be used as ads and appear on all feeds regardless of their interests.

7. Feed .

This is where the customers will have access to user generated content, posted on the POV, this will allow customer convenience because it will allow them to have a look around at the entire market and decide on what to buy based on the research done from scrolling and seeing other people's POVs.

This user generated content will ensure people stick around on the app more and as they do, it will lead them to spending more by shopping more. This will lead them to leaving their own pov and sharing their experiences with their friends on the platform.

8. Data collection.

We need to be able to track what people are buying, what is in stock, what is being liked by the community, what people are adding into their carts. What businesses people like most, which has the best traffic. What items are popular.

9. QR code generator.

This is useful in getting customers and users to interact with the system first hand.

10. Mpesa checkout

The platform should be able to complete transactions, on site, if not possible redirect to whatsapp when they click checkout.

Proposed pages

- 1) Landing page
- 2) User registration and login page
- 3) Business registration and login page
- 4) Business profile page
- 5) Customer UGC content feed page.
- 6) Product and services marketplace page
- 7) My POV content creation page
- 8) Search and discovery page
- 9) Customer dashboard.

Visual elements.

A honey comb vector pattern everywhere. Find picture attached.

Theme colours

Navy Blue to signify trust and reliability

Amber the colour of the bee.

White for contrast in the letters to the navy blue

Amber again for the tagline, “ for you by you”

Scope of the system.

The customer user can register or log in. they can receive notifications. They can see the businesses in their local areas. They can be notified if their friends are on the platform. they can pick a few things they are interested in. they can edit this any time. can view a feed and see POV user generated content. They can like and leave comments on the pov content. They can see the rating a business has, what did the client rate them on the star system. They can see the name of the business. They can see the name of the maker of the pov. They can click on the name of the

business and go to the business profile. They can follow anyone and any business. They can see more POVs on the public profile of the business. They buy or add to cart from the product shelf on the business profile. They can see the prices of these goods. They can see when the business is operational. They can make orders and eventually make payments. They can see the location of the business and contact information of the business. They can search and explore the market place. They can see a specifically searched product and see the businesses that offer it. They can see how many reviews a business has and its most recent rating, based on the star metric. They can tap on the business and be taken to the business page and they can see the reviews and the products and their prices. They can post povs. They can delete povs they posted. They can send messages.

Scope of the business user.

The user can register and login. They can say the name of the business. They can pick something they are interested in. They can put in their contact information. They can put in their location.
